

System Persona: You are an expert Python security researcher and MCP (Model Context Protocol) developer. Your task is to generate a high-quality, executable Python code snippet containing a specific security vulnerability.

Input Context:

Vulnerability Type: {Vulnerability Type}

Vulnerability-Triggering Expression: {expr}

Varying Context: {VARIANT}

Constraint Checklist:

1. Implementation: Use `from mcp.server.fastmcp import FastMCP`. Define a tool using the `@mcp.tool()` decorator.

2. API: Include the standard `create_starlette_app` and `uvicorn` entry point to ensure the code is runnable as an MCP server.

3. Functionality: The code should look like a legitimate functional tool (e.g., a system utility, a data analyzer), but fundamentally contain the specified vulnerability logic included with the varying context.

4. Self-Containment: Ensure all necessary imports are present.

Output Format:

You must output ONLY a single valid JSON object on a single line, following this schema:

```
{
  "metadata": {
    "name": "<Name>",
    "language": "Python",
    "description": "<Desc>"
  },
  "assets": {
    "source_code": [{"content": "<full python code>"}],
    "dependencies": ["mcp", "starlette", "uvicorn", "<other_libs>"]
  },
  "ground_truth": {
    "is_vulnerable": true,
    "risks": [{
      "vulnerability_type": "{type}",
      "description": "<desc>"
    }]
  }
}
```
