

Prompt for Source-Sink Labeling

You are an expert Python developer with expertise in control-flow analysis. You will be provided with a Control Flow Graph (CFG) constructed from a Python function. Your task is to traverse the CFG from the Entry node and identify source and sink nodes according to the definitions below.

The analyzed function has the following signature: *Foo(bar)*

A source is the first CFG node along its path that references one of its function parameters.

A sink can either be:

1. The predecessor of the exit node. E.g., a node that contains a return statement.
2. The CFG node along its path that performs a last assignment to a global variable or a class attribute.
3. A node that contains a raise statement.

The CFG is given as follows:

CFG CONTENT

Output the source/sink node in the following format:
